

MOTO8K

Apparently the new Moto8K is amazing:

With its typical American aesthetic, the new peak, the ventilation system with air-channels, the ventilated linings, the new Moto8K is a European breed of helmet – different from the various productions of China – most of nowadays production.

A Moto8K helmet is designed and built in Europe to last and survive trend changes.

In the first instance when you'll wear a Moto8K you feel it comfortable and light. When you will use it you feel your head particularly in "fresh air".

Ventilation is one of the main topics of the Moto8.

It uses 11 air ducts, developed from rider experience, aerodynamic tests and thanks to computer CAD simulations.

The peak is easily adjustable with the two metallic screws.

The washable inner comfort lining is particularly innovative: made of seven pads of variable thickness designed to support your head in seven areas with full air circulation.

This kind of structure allows you to custom fit the comfort to your head shape. In fact the pads are removable one by one and interchangeable with thicker or thinner ones.

Other features:

- Ventilation: Extra vents for full venting.
- Liner coverage for best inner washing

The best fibre's technology for high performances has been used to produce this helmet.

Different shell sizes developed in ULTRA LIGHT MULTIAXIAL CARBON ARAMIDIC FIBERS in order to obtain the maximum of the resistance with the minimal weight.

The paint work of the Moto8 has been the subject of full attention with several layers of UV resistance coating to guarantee durability.
